Map created on May 13, 2010

Wisconsin Wetland Inventory (WVI) maps show specific delineations of the lines, sites and features of wetlands in Wisconsin. These maps have been prepared from the best available data, including aerial photography, topographic maps, previous wetland inventories and field work. State statutes define a wetland as "an area where water is at, near or above the land surface, long enough to create or support aquatic or hydrophytic vegetation which has a surface of high water content." The WVI is to produce reconnaissance-level information on the location, type, size of these wetlands, such that they are accurate at the northeast scale of the 1:24,000 (1 inch = 2000 feet) base map. The DNR recognizes the limitations of using aerial photography as the sole data source for wetland delineation. State, or local government or its designated agency personnel are responsible for providing the geographical scope of the regulatory program of government agencies. Persons interested in exploring or acquiring wetland modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, State, or local agencies concerning applicable regulatory programs and procedures that may affect such activities. The most accurate method of determining the legal extent of a wetland for Federal or state regulations is a field delineation of the wetland boundary by a professional trained in wetland delineation techniques.
